Hi Phil,

Thanks for your quick response. I know about the plan for the new UAA, but the great concern is how the presence of aquatic life (found by EPA in 2007) has been ignored by the state and was ignored through the development of the GP permit and therefore there are not effluent limits in place that can protect for the aquatic life that your colleagues/consultants found. It would not be hard to imagine that ADEQ will find no aquatic life in that same stretch – whether they have been killed off or they just don't look as hard as the previous investigators looked is the question. Is EPA involved in the UAA this time around at all?

The state told us in November they “questioned the methodology” of the previous UAA. That would perhaps be a plausible reason for performing another UAA IF there had not been any aquatic life found and the conclusions were more about the potential for attainment of aquatic life use. The extent of the pollution discharging into Coffee Creek has everything to do with the inadequate limits in the permit.

While the attached news article focuses on another requirement of the Arkansas water quality standards, the fact that the plant is in compliance with a permit that is not adequate to protect the existing uses (at least as they were documented in 2007) is the problem.

Because the UAA process has been widely used to exempt many Arkansas waters from Clean Water Act protections is a broader concern. I plan to follow up with ADEQ on these points as well as folks at EPA HQ. I would welcome the chance to talk with you more about Region 6's role in improving the conditions in Coffee Creek, Mossy Lake, Oachita River as well as all the Arkansas waters that have been subject to UAA or site-specific criteria. As you know, both of those processes are supposed to be revisited every three years.

Thanks, Phil. I appreciate your response.

Hi Gayle,
Thanks for this information and your interest in investigating this. The state has since agreed to conduct their own UAA with Georgia-Pacific. We'll touch base with them on that to make sure there is movement, and share this information with our permits and enforcement folks.

Hi Phil,

I spoke with you and Matt in November and then Matt again in December about our concerns regarding Arkansas' inaction related to the findings in EPA's 2007 UAA for Coffee Creek and Mossy Lake in Arkansas. As I mentioned, we witnessed disturbing conditions just downstream of the GP treatment pond (which seems to be essentially in Coffee Creek).

I haven't heard back from Matt regarding this issue since our last conversation, so I thought I'd better reach out to you.

Here is a story that has just been posted by CBS on this matter. Even without appropriate uses and effluent limits in place, there are egregious violations from this mill. This is unacceptable and could have been corrected in the issuance of the 2010 permit if appropriate regulatory action had been taken on the UAA findings in this year's triennial review.

http://www.cbsnews.com/8301-31727_162-20043531-10391695.html

We hope you will take appropriate steps to correct this situation.
